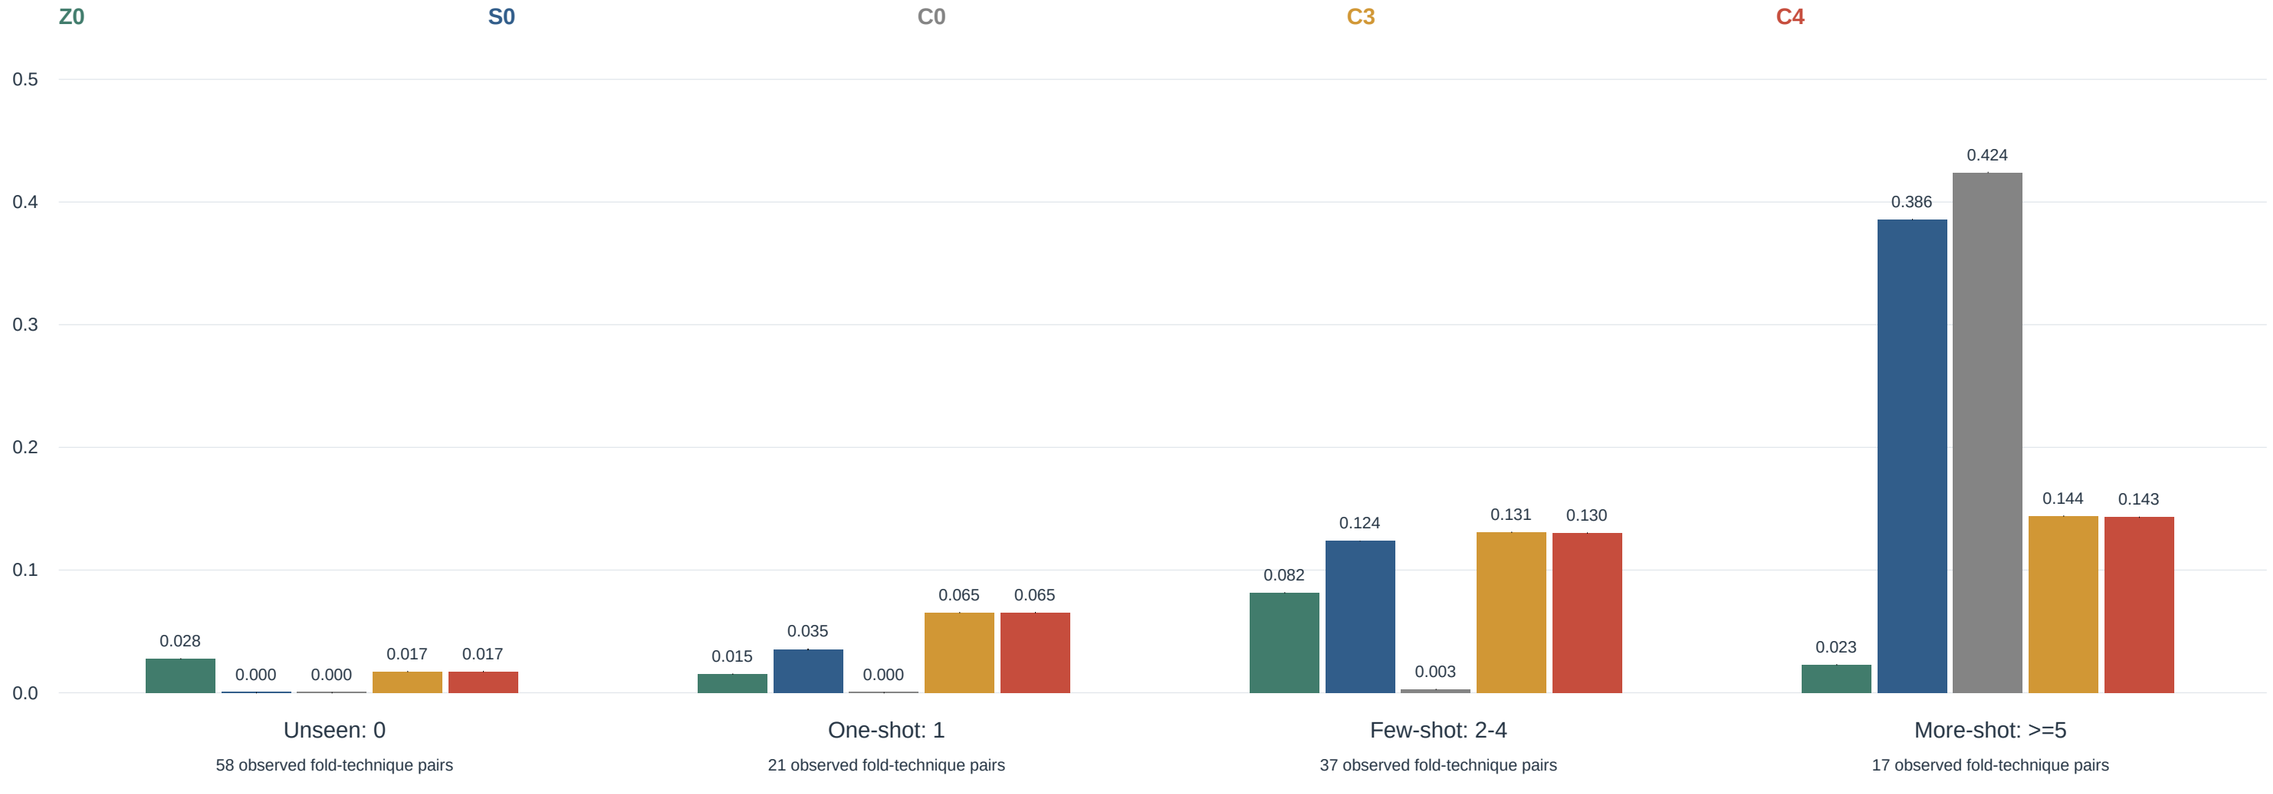
Training-frequency gains concentrate on well-supported classes

ONE view; class-macro MRR over observed (fold, technique) pairs, giving each pair equal weight.



C0 frequency-only MRR is strong overall, but its one-shot class MRR is 0; high support drives its ranking gains.

Support counts unique training logical steps; five sampled queries never count as five supports. Buckets may differ across folds.

Bars: 3-seed means with seed SD. Classes without heldout positives have NA class MRR; all216 remain in Macro-F1 evaluation.
